### INTRODUCTION

This report is divided into two parts. Part I consists of an analytical survey of the Vital Statistics of the province in the form of narrative summaries, summary tables and charts. Its objectives are (1) to indicate (in so far as can be portrayed by vital statistics) the general trend over the past several years, in the general state of the health of the people of Ontario; (2) to assess the vital statistics of 1942 in the light of these general trends; and (3) to bring to light certain specific problems in the field of public health, such as infant and maternal mortality and deaths from specific diseases such as cancer and tuberculosis and those resulting from accidental causes. Part II consists of detailed tables covering vital statistics for the year 1942. In the interests of economy several tables are not printed in this report. These are listed in the Table of Contents and the information is available upon request providing that such requests, in the opinion of the Registrar-General, are sufficiently warranted and urgent in the public interest.

### PART I.—COMPARATIVE AND ANALYTICAL SUMMARY

### **Population**

For reference purposes the estimated population of the province over a period of about two decades is shown by sex in Table A, while a distribution by sex and age-groups of the estimated population of 1942 is provided in Table B.

TABLE A—POPULATION, CENSUSES 1921, 1931 AND 1941 AND ESTIMATED FOR INTERCENSAL YEARS, BY SEX, ONTARIO

Year	Total	Male	Female	Year	Total	Male	Female
1921	2,933,662	1.481.890	1,451,772	1932	3,475,000	1,770,000	1,705,000
1922	2,980,000	1,507,000	1,473,000	1933	3,564,000	1,814,000	1,750,000
1923	3,013,000	1,525,000	1,488,000	1934	3,629,000	1,847,000	1,782,000
1924	3,059,000	1.550,000	1,509,000	1935	3,673,000	1,868,000	1,805,000
1925	3,111,000	1,578,000	1,533,000	1936	3,689,000	1,875,000	1,814,000
1926	3,164,000	1,606,000	1,558,000	1937	3,711,000	1,886,000	1,825,000
1927	3,219,000	1.635,000	1.584,000	1938	3,731,000	1,895,000	1,836,000
1928	3,278,000	1,666,000	1,612,000	1939	3,752,000	1,905,000	1,847,000
1929	3,334,000	1,696,000	1,638,000	1940	3,763,000	1,910,000	1,853,000
1930	3,386,000	1,724,000	1,662,000	1941	3,787,655	1,921,201	1,866,454
1931	3,431,683	1,748,844	1,682,839	1942	3,825,000	1,939,000	1,886,000

Figures supplied by Social Analysis Branch, Dominion Bureau of Statistics.

<sup>\*</sup>These estimates do not take into account interprovincial migration, figures for which are not available for intercensal years.

The rural and urban distribution of the 1942 estimated population was as follows:—

Population Group	Estimated Population	Per cent
Incorporated centres (1)—10,000 population and over.	1,768,506	46.2
Incorporated centres (1)—5,000 to 10,000 population Incorporated centres (1)—1,000 to 5,000 population	301,463	5.8 7.9
Rural Population (including incorporated centres under 1,000*)		40.1
*As at Census of 1941.		

### **Natural Increase**

The natural increase in the population and the computed rates for the period 1922 to 1942 are shown in Table C.

TABLE C—NATURAL INCREASE AND NATURAL INCREASE RATES, ONTARIO, 1922-1942

Year	Live Births	Deaths	Excess of Births over Deaths	Natural Increase Rate per 1,000 Population
1922	71,430	34,034	37,396	12.5
1923	70,056	35,636	34,420	11.4
1924	71,510	33,078	38,432	12.6

The natural increase rate has shown a general downward trend during the past two decades with a considerable recovery taking place since 1939. This is attributable, to a large extent, to a sudden rise in the birth rate associated with the war. The lowest rates were reached in the immediate post-depression period of 1933 to 1939, as is clearly shown in Chart 1. The main factors throughout were naturally a general falling birth rate and a relatively stable death rate for the total population despite an increase in the deaths among the higher ages which is directly associated with an ageing population.

#### Births

Table D presents an historical summary of births, stillbirths and illegitimate births, together with computed rates for each, while Chart 1 portrays the general trends over the same period.

TABLE D—SUMMARY OF LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS, AND RATES, ONTARIO, 1922-1942

The number of live births has shown a more or less general decrease from 1922 to approximately 1937 when 61,645 births were registered. There was some recovery up to the war period followed by a decided increase accompanying the war. Live births in 1942 were 8.2 per cent higher than in the previous year and almost 22 per cent higher than in 1939. The crude birth rate of 20.4 in 1942 was almost as high as that attained in 1928 and 1929, a prosperity period.

The stillbirth rate, on the other hand, has been on an extremely encouraging downward trend with a reduction of almost 39 per cent since 1922. In 1922 for every 1,000 babies born alive, 44 were stillborn, while in 1942 there were less than 27 stillborn—a fact which may be taken as a partial reflection of the improved health of mothers in the province and the improvement in obstetrical services.

Illegitimacy, however, has been increasing at an alarming rate—3,789 illegitimate births being registered in 1942 as compared with 1,519 such births in 1922. The rate has risen 1½ times since 1922 with over 48 of every 1,000 births in 1942 being illegitimate as compared with 21 in 1922 and 40 in 1931. It will be noted, however, that in the period 1922-1931 the rate rose 88 per cent as compared with a rise of only 21 per cent since that period.

Tables E, F and G, provide a breakdown of births by age of mothers for the same three groups, and indicate to some degree the extent to which age has contributed to the trends outlined above, while Chart 2 provides an interesting picture of the age distribution over the same period on the basis of five-year averages.

NOTE:—Births to mothers of "not stated" ages have been distributed on the basis of specified ages.

Chart 2

# PERCENTAGE OF LIVE BIRTHS, STILLBIRTHS AND ILLEGITIMATE BIRTHS IN EACH AGE-GROUP OF MOTHERS ONTARIO

There has been a general tendency during the past two decades towards younger motherhood. For example, of every 100 babies born alive in 1922, 6 were to mothers under 20 years of age, over 24 to mothers 20-24, and 28 to mothers 25-29 or a total of 59 children to mothers under 30 years of age. In 1942 of very 100 live births, 8 were born to mothers under 20, 30 to mothers 20-24, and almost 30 to mothers 25-29 or a total of 68 children to mothers under 30 years of age. The picture, however, is not complete without mentioning the fact that fewer children are now being born to each mother than was the case two decades ago, and these are being borne in the early years of married life.

As a partial effect of the trend towards younger motherhood, a greater percentage of stillbirths is now occurring at the younger ages than was the case in 1922. In 1942, 6.8 per cent of the stillbirths were to mothers below 20 years of age as compared with 4.7 per cent in 1922, and 22.1 per cent as compared with 21.0 per cent to mothers 20-24, while proportionate declines are evident among older mothers, particularly those in the late thirties. In 1942 of every 100 stillbirths, 45 were to mothers over 30 years of age as compared with 50 in 1922 and over 49 in 1931.

There are indications that the number of stillbirths per 1,000 deliveries has been decreasing at an encouraging rate over the past two decades, and that this has been evident for each age-group of mothers, although the fact remains that the risk of stillbirth delivery increases with age. The following summary sufficiently indicates the general trend in this report over the 20-year period. For example, of every 1,000 deliveries among mothers 15-19 in 1942, 22 were stillborn as compared with 29 in the period 1922-27; among mothers 20-24 years of age, 19 as compared with 30; among mothers 25-29 years of age, 23 as compared with 33, with similar encouraging figures for older mothers, although the risk of stillbirth delivery increases rapidly for mothers over 35 years of age.

### AVERAGE NUMBER OF STILLBIRTHS PER 1,000 DELIVERIES

Years						
	15-19	20-24	25-29	30-34	35-39	40 and over
1922-27 1928-32 1933-37 1938-42 1942	29 27 27 24 22	30 27 25 21 19	33 30 28 25 23	39 37 34 31 29	49 48 45 43 41	64 63 64 58 57

With respect to illegitimacy, Table G and Chart 2 indicate that the great majority of the illegitimate live births occur to mothers under 25 years of age.

Of every 100 such births in 1922, 74 were to this group of mothers, as compared with 68 in 1942.

In recent years a greater proportion of illegitimate births are ascribable to mothers in the older ages, relatively high percentages occurring to mothers in their 30's, with proportionate reductions among mothers in the 'teen ages. Chart 2, particularly, illustrates this fact.

### **Infant Mortality**

Table H and Chart 3 both indicate very clearly the declining trend in the number of deaths of children under one year of age, and reflects to a larger extent the success of a long-range programme directed during the last two decades at the reduction of infant mortality.

### INFANT MORTALITY

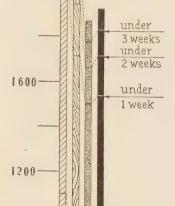

DEATHS AT EACH AGE PERIOD

and for the year 1942

### LEGEND

Ō\_

Years	Infant Deaths per 1,000 Live Births
1921-25	83
1926-30	
1931-35	61
1936-40	
1941	46
1942	40

A reduction in the number of infant deaths is apparent for each of the successive periods indicated, and this for every monthly age-group, with the 1942 figures significantly lower than the average of the last 10 years. Any increases which are noted for 1941 and 1942 must be considered in comparison with the extensive increase in the number of births during the same two years. In the support of this statement, the following summary, indicating the number of infant deaths per 1,000 live births, presents possibly a more accurate picture of the rapid reduction in the rate of infant mortality than that obtained by a consideration of the total number of deaths occurring in the first year of life.

Table I shows that there has been a notable reduction in infant deaths attributable to certain causes, particularly in those due to the diseases of early infancy, of the digestive tract and of the respiratory organs, including whooping cough and influenza, while no improvement in the death rate from malformations is apparent.

### **Maternal Mortality**

From Table K, it will be noted that a considerable reduction in the number of deaths of mothers during childbirth has taken place during the past 20 years, and particularly during the past 5 years, with the 1942 rate being considerably below the average of the last decade. In general, the reduction in the rate seems to be more apparent in younger than in older mothers, although in 1942, the latter group showed a marked decrease in the rate per 1,000 live births.

<sup>\*</sup>Rates not computed because of small numbers.

The tables which follow present the distribution of maternal deaths during 1942 by locality, as well as deaths of women not directly classified as due to pregnancy or child-birth, but which were associated therewith.

The rates shown in Table L are of special interest in that they indicate clearly not only the general downward trend in maternal mortality as between cities, towns and rural areas of the province but that the maternal mortality rates during the past three years have been somewhat higher in towns than in cities and lowest in rural communities, the rates for 1942 being 2.9 per 1,000 live births in cities, 3.1 in towns and only 2.0 in the rural areas. The rural rates have been consistently lower than those for the urbanized communities.

### General Mortality

Table N presents a historical summary of deaths by sex in the province and the computed crude death rates over a 20-year period while Chart 1 presents a graphic picture of the general trend in the rate.

Over the past two decades two main trends are apparent. From 1922 to the early 1930's the rate averaged close to 11 deaths per 1,000 population. Dropping rapidly in 1931 and 1932, it has since stabilized at about 10 deaths per year per 1,000 population.

The death rate among males has been consistently higher than that among females and there are indications that this divergence between the two rates has been widening during the past decade or more. During the past three years the male rate has been influenced, of course, by deaths among the Armed Forces.

TABLE N—DEATHS (EXCLUSIVE OF STILLBIRTHS) AND DEATH RATES PER 1,000 POPULATION, ONTARIO, 1922-1942

Year	\	DEATHS		RATE PER 1,000 POPULATION

942	39,119	21,349	17,770	10.2	. 11.0	9.4	

Table O presents both male and female crude death rates for each 5-year age-group, based on the population as enumerated at the censuses of 1921, 1931 and 1941 and as estimated for the year 1942. There are several features with respect to changing death rates which are worthy of comment, notable among which is the remarkable decrease in the death rate of children under 5 from 31.8 and 24.8 in 1921, to 13.6 and 10.5 in 1942, for males and females, respectively. Similar declines are apparent in the other age-groups up to middle life. After middle life an increase in the rate will be noted. In other words, the life expectancy of the population has been greatly increased over the past 20 years, with a larger proportion of deaths now occurring at the older ages than was formerly the case.

This latter fact is clearly portrayed in Chart 4 which depicts the percentage of deaths occurring in each age-group of the population.

### The Ten Leading Causes of Death

In Table P it will be seen that during the past 10-year period diseases of the heart, cancer, diseases of the arteries, and accidental causes have ranked in this order as the main causes of death in Ontario, except for the period 1936 to 1940, when diseases of the arteries ranked second and cancer ranked third. In 1941 nephritis moved to 5th place from 6th, and intracranial lesions of vascular origin to 6th from about 9th place. Pneumonia, on the other hand, has dropped from 5th to 7th place, diseases peculiar to the first year of life from 7th to 8th, and tuberculosis from 8th to 9th place. In 1940, diabetes displaced influenza and diarrhoea and enteritis as the 10th main cause of death.

In 1942 diseases of the heart accounted for almost 31 of every 100 deaths, with a rate of 315.5 per 100,000 population. Cancer and diabetes rates have also

shown considerable upward trends over the past 10 years. In 1942 diseases of the heart and arteries and cancer together accounted for over half of the deaths in the province.

(1) Per cent of total deaths.
(2) Rate per 100,000 population.

Note: It should be noted that the effects of certain changes in classification and rearrangement of titles provided in the Fifth Revision of the International List of Causes of Death are apparent in the following: Tuberculosis, Diseases of the heart, Diseases peculiar to the first year of life, Diseases of the arteries and intracranial lesions of vascular origin.

### The Four Chief Causes of Death in each Age-Group

Table Q shows the four primary causes of death in each age-group for 1942. In brief, it will be seen that accidents, or other violent causes, are the main cause of death of persons from 1 to 39 years of age. From 5 to almost 39 years of age tuberculosis was the second chief cause of death. Diseases of the heart affect those in the late 20's and after 40 years of age increase with age as the chief cause of death. Cancer does not appear as a main cause of death till the late 30's, increasing with age and particularly affecting persons in their 60's, then decreasing from that point as a primary cause of death. In general, diseases of the heart and arteries, cancer, intracranial lesions of vascular origin and nephritis are the primary causes of death of persons over 50 years of age.

### Mortality from Notifiable Diseases

A summary of deaths and death rates from notifiable diseases is shown in Tables R (1) and R (2) for the last 10-year period. The 1942 figures were consistently lower than those for the previous year for all diseases except chickenpox. In general, from 1933 to 1942 deaths from diphtheria, erysipelas, scarlet fever and typhoid fever have been on a general downward trend. Deaths from influenza have shown a decided decline except for minor epidemics in 1937 and 1939. Deaths from poliomyelitis have shown the same trend except for the year 1937, as well as those from whooping cough except for the year 1941. Deaths from tuberculosis are discussed in detail in the section to follow.

# Mortality from Tuberculosis

Chart 5

# DEATHS FROM TUBERCULOSIS, CANCER AND PNEUMONIA ONTARIO, 1900 - 42 Rates per 100,000 population

Tables S (1) and S (2) show the deaths from all forms of tuberculosis in the province from 1933 to 1942 as well as death rates per 100,000 population classified by the age of the decedents. There have been two main trends in the total numbers of those dying from tuberculosis; namely, a gradual decline from 1,465 deaths in 1933 to 1,237 in 1938, followed by a levelling off during the past four years with an average of 1,072 deaths per year. The death rate, on the other hand, has shown a steady decline from 41.1 per 100,000 population in 1933 to 26.9 in 1940 followed by slightly increased rates of 29.0 and 28.6 in 1941 and 1942, respectively. Chart 5 illustrates the decided reduction in mortality from tuberculosis which has taken place since the beginning of the century.

The largest number of deaths occurred, in 1942, in the age-groups 50 to 69 followed by those in the 20's and early 30's. Since 1933 there has been a remarkable decline in the total number of deaths in younger age-groups whereas deaths in the older age-groups have not declined appreciably since 1933. The rates, however, in the ages approaching middle life, in all instances have been either more than halved or greatly reduced. Although the number of deaths of children under four years of age has always been relatively small, since 1933 there has been a drastic reduction in the death rate among this group of the population.

Table 48, in Part II of this report, gives details of deaths and death rates for counties, according to place of occurrence and place of residence, for the year 1942.

#### Mortality from Cancer

As illustrated in Tables T (1) and T (2), and in contra-distinction to tuber-culosis mortality, the total number of deaths from cancer has been generally increasing since 1933. This has been more or less apparent in each age-group and particularly so among older persons. In addition, the general cancer death rate has been rising over the past decade, standing at 130.8 deaths per 100,000 population in 1942, as compared with 130.2 in 1941 and 113.5 in 1933. Chart 5 illustrates the steady upward trend in the mortality rate from cancer since the beginning of the century.

Cancer is definitely a disease of old age, beginning its ravages in the late 30's or early 40's and increasing rapidly with age. Any reduction in the death rate which has taken place during the past decade has been in the younger agegroups of the population.

The number of deaths from cancer classified by sites affected is given in Table U for the period 1933 to 1942. Cancer of the digestive organs and peritoneum accounts for almost half of the deaths from this disease, with an increase of 18.6 per cent in the number of deaths occurring in this group since 1933. The number of deaths from cancer of the male and female genital and urinary organs has increased over 25 per cent since 1933, cancer of the breast 38 per cent, while cancer of the respiratory organs has more than doubled during the same period.

## Mortality from Pneumonia

In Chart 5 it is readily seen that the death toll from one disease, namely Tuberculosis, has been very rapidly reduced over the past 40 years. On the other hand, the death toll from Cancer has shown almost a steady incline. Also included in the chart is a curve portraying the trend in the death rate from Pneumonia, a disease which may be affected by epidemics as illustrated by the peaks of 1907, 1916 and 1918. Here also, however, is revealed the effect of the public health programme in that during the past 20 years or more the general trend in the death toll from this disease has been on a fairly general downward trend. The maintained drop in the curve is more noticeable since the introduction of the sulpha drugs for the treatment of respiratory diseases.

## Special Classes of Accidental Deaths

Table V shows that of 2,452 accidental deaths in 1942, cross-classified according to nature of injury, 1,011 were attributable to crushing, 816 to falls, 330 to drowning, 166 to burns and 129 to poisonous gas, suffocation, electrocution, etc. Of those injured by crushing, 491 deaths were attributable to automobile accidents (excluding trains or street-cars), 139 to railway accidents (excluding motor vehicles) and 136 to air transport accidents.

# TABLE V—SPECIAL CLASSES OF ACCIDENTAL DEATHS CLASSIFIED ACCORDING TO NATURE OF INJURY, ONTARIO, 1942

# Marriages

From Table W it will be noted that there have been significant fluctuations in the number of marriages in the province since 1922, each of which have reflected general economic trends. For example, there was a general increase in marriages and in the marriage rate leading up to 1929, a prosperity period, followed by a decline coincident with the depression period which continued till approximately

1933. This was followed by a return to a more stable economic condition which is reflected by an increase in both the total number of marriages and the marriage rates. The effect of the war is clearly apparent in the relatively high rates of 11.0, 11.4 and 11.9 per 1,000 population during the last three years.

TABLE W—MARRIAGES AND MARRIAGE RATES PER 1,000 POPULATION, ONTARIO, 1922-1942

Year	Number	Rate per 1,000 Population	Year	Number	Rate per 1,000 Population
1922 1923 1924 1925 1926 1927 1928 1929 1930 1931	23,074 23,632 24,677 25,728 27,605 25,605	7.8 8.2 7.9 7.4 7.5 7.7 7.8 8.3 7.6 6.9	1932 1933 1934 1935 1936 1937 1938 1939 1940 1941	22,224 22,587 25,874 26,843 27,734 29,893 30,080 34,657 41,229 43,270 45,466	6.4 6.3 7.1 7.3 7.5 8.1 8.1 9.2 11.0 11.4 11.9

#### **Divorces**

In Ontario, divorced persons form a very small proportion of the population as compared with some of the other countries of the world. The following summary indicates the number and percentages of such persons in the population of the province as enumerated in the past three censuses.

0	1921*	1931	1941
Divorced persons—MaleFemale	1,135 1,369	1,071 1,015	2,291 2,865
Per cent of population—Male	0.08	0.06	0.12
*Including legal separations.	0.03	0.00	0.10

An historical summary of the number of marriages dissolved in Ontario since 1919 is presented in Table X. Previous to 1920 very few divorces were granted in the province. There was no appreciable increase in the number till the late 1920's, but since the transfer in 1930 of jurisdiction from the Dominion Parliament to provincial courts there has been a steady annual increase (except in 1937) in the number of divorces. Previous to 1930 a record number of 213 (1928) divorces were granted. From an annual average of somewhat over 300 in the early 1930's the number has increased rapidly to 949 in 1941 and 1,185 in 1942, representing an increase in the rate per 100,000 population of from 9 or 10 to 31 in 1942.

In the early 1920's the majority of the successful applicants were husbands, but since that period dissolutions granted on the application of wives have been in the great majority. Since 1935 for every 1,000 divorces granted to wives, an average of 550 have been granted to husbands as applicants, the ratio in 1942 being 576 per 1,000 divorces granted to wives.

TABLE X—DISSOLUTIONS OF MARRIAGE (DIVORCES) AND RATE PER 100,000 POPULATION, 1919-1942, AND RATIO OF DISSOLUTIONS TO MALES AND FEMALES, 1935-1942

Year	Dissolu-	Rate per	Year	Dissolu-	Rate per 100,000	Year	Dissolu-	Rate per 100,000	DISSOL GRANTE		Ratio of Dissolutions to Males
